EPS

The trusted system for affordable security

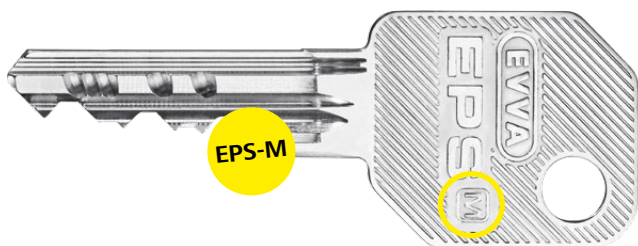

EPS key | reliable technology in robust design

The established EPS technology is ideal for a wide range of use. The EPS key is a strong nickel silver key with large key cross-section. This makes them wear-resistant and durable.

The distinctive side codes and the associated manipulation control ensure a higher level of security.

By the way: you can lock all doors with just one EPS key. Whether it's the entrance, cellar, garage or annex.

EPS-M | lifelong brand protection

Lifelong international brand protection can be identified by the EVVA logo on the key's profile. EVVA can take legal action if it comes to light that key copies have been commercially produced without authorisation.

EVVA | unique security

EVVA continuously invests in research and development and always strives to develop new key technologies. As a result, EVVA always meets the increasing requirements for security and organisation.

Additional security with the EVVA security card and patents

The genuine EPS key is produced exclusively by EVVA. Copy keys, additional cylinders and lock charts are exclusively available from an authorised EVVA Partner and with the EVVA security card only. EVVA prevents keys from being produced without authorisation with patented features on the key.

In any situation | more protection

The reliable technology of the EPS cylinder offers lasting protection against illegal opening methods. It features hardened steel elements as standard for protection against drilling.

Picking protection makes the EPS cylinder harder to open with locksmith tools. Optional: EPS cylinder with enhanced drilling protection thanks to hardened metal elements as well as special hardened metal sliders offering resistance against pulling the cylinder and plug in accordance with standards.

Select ergonomic, design key bows

EPS keys are optionally available as high-grade design keys. The attractive design is available in black, red and blue.

Benefits

- Easier to distinguish the keys
- Simple management of master key systems thanks to colour allocation
- High quality for improved haptics
