Everything about Xesar –
easily explained.

n for your business <

Xesar | Secure and flexible

Xesar is the versatile electronic locking system by EVVA. Xesar solves complex tasks easily, securely and individually. Easy installation on-site and the free Xesar software are only some of the many benefits of Xesar. Ideal for industrial companies, authorities, schools and companies that prefer a closed system featuring independent IT infrastructure.

Your Xesar benefits at a glance:

- › A more cost-effective solution for businesses
- › Versatile product range
- › Virtual network

Xesar | An overview of the system

This is how it works

All access authorisations are granted in the Xesar software. Information is transferred to identification media via the coding station to easily create electronic keys.

Thanks to the Xesar tablet individual locking components are synchronised with the software during commissioning. Within the Xesar virtual network the identification media in circulation distribute the security information (blacklist) throughout the facility.

Xesar identification media

Provide identification at the door with cards, key tags or combi keys.

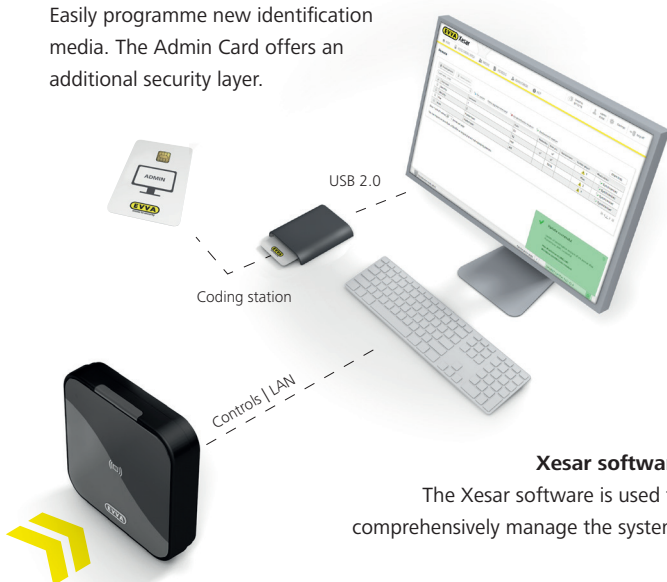

Xesar access components

Xesar escutcheon, handle, cylinder and wall reader are programmed using the Xesar software.

Coding station and Admin Card

Easily programme new identification media. The Admin Card offers an additional security layer.

Xesar software

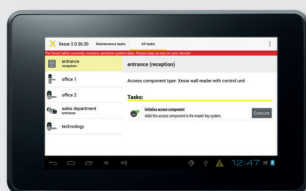

The Xesar software is used to comprehensively manage the system.

Xesar wall reader as updater

Permanent security updates from identification media or doors via the virtual network.

Xesar tablet

Use the Xesar tablet for security updates on doors whenever you need to act quickly.

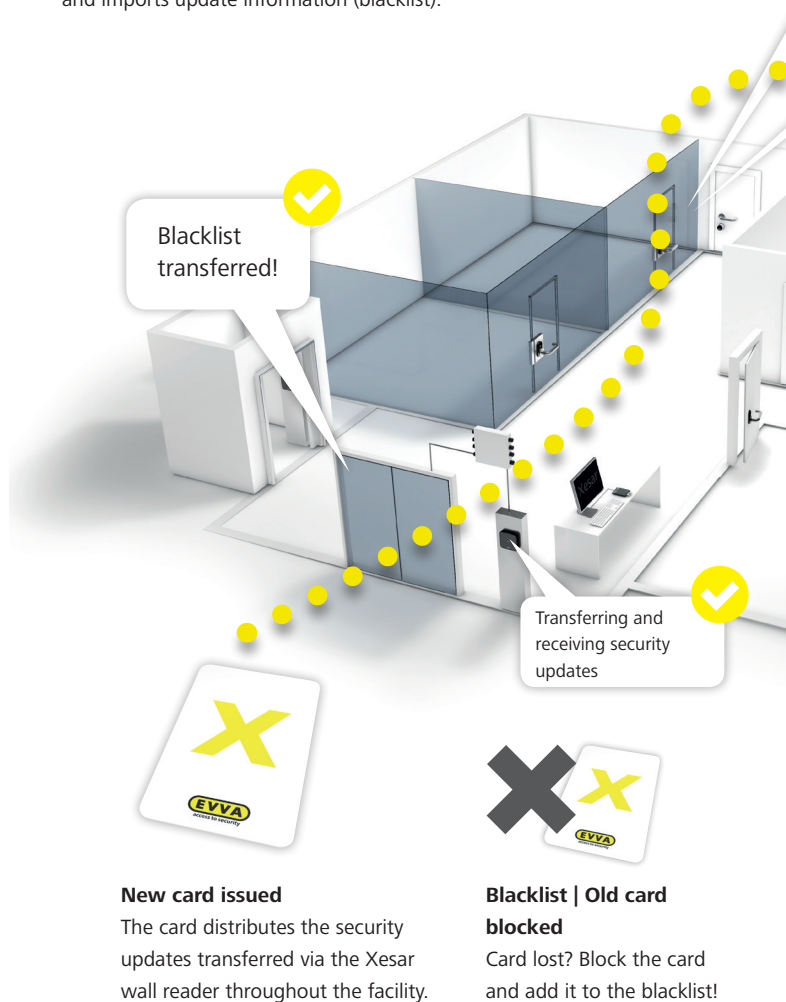

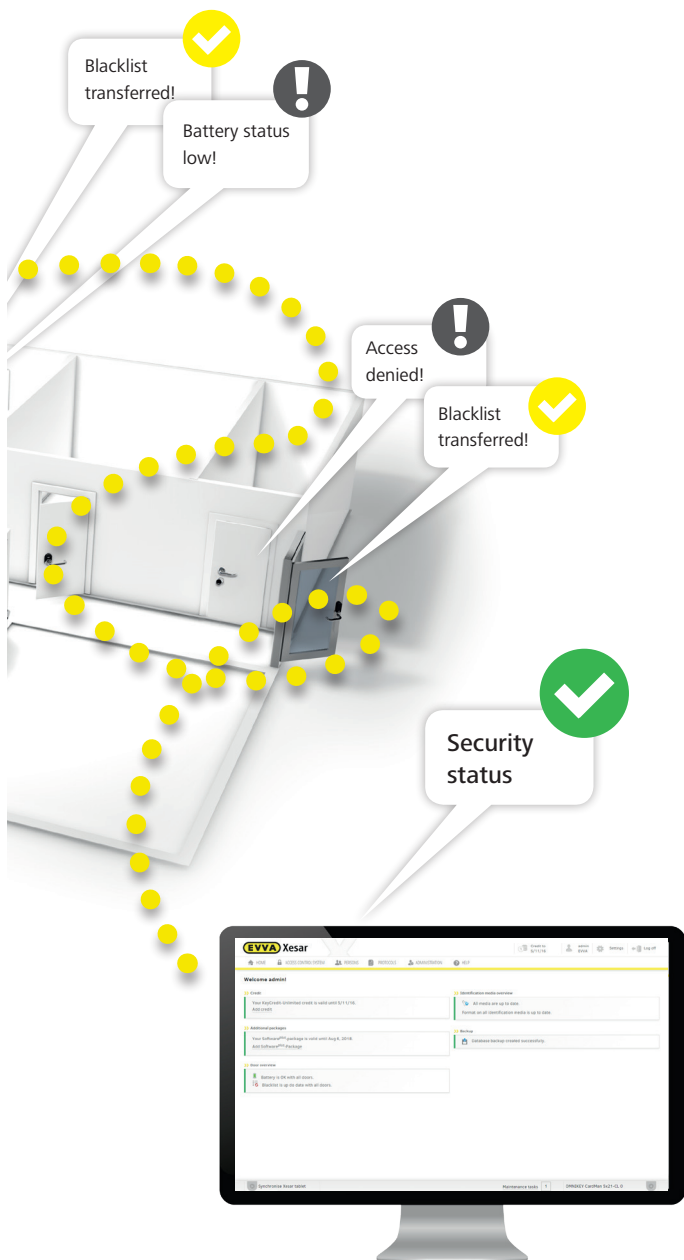

Xesar | The virtual network

This is how it works

The Xesar virtual network uses the issued identification media to exchange information between software and doors to always keep the system up to date.

The Xesar wall reader with updater control units extends the validity period of identification media by the configured period and imports update information (blacklist).

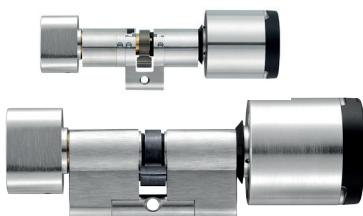

Xesar | Four strong performers

The Xesar handle

The Xesar handle is the ideal indoor solution. Our extensive range of handles and finishes provides the perfect solution for every situation. On-site assembly is quick and easy – simple screw on and it is ready to use.

The Xesar cylinder

The Xesar cylinder is suitable for indoors and outdoors and features all vital security characteristics. The modular design of the Xesar cylinder allows length adaptations on-site and makes planning easier.

The Xesar escutcheon

The Xesar escutcheon boasts a slim design with clear lines and includes an integrated reader unit. It is suitable for an ample range of models, such as solid and metal frame doors as well as panic bar solutions or fire doors.

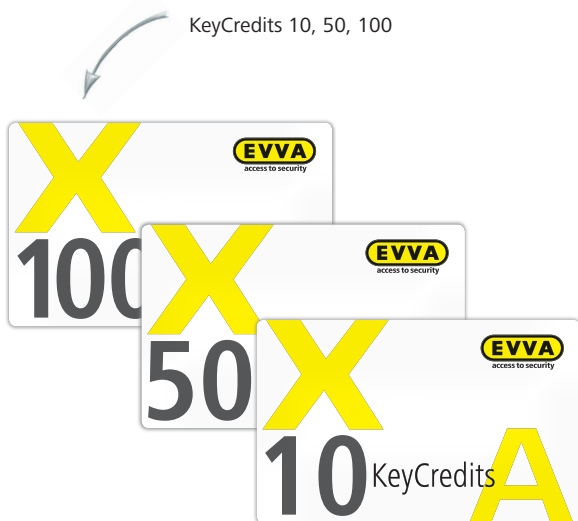

The Xesar wall reader

The Xesar wall reader features a sophisticated glass front and is suitable for indoors, outdoors, lifts, sliding and swinging door.

In combination with the updater control unit it keeps the system secure and up-to-date via the virtual network.

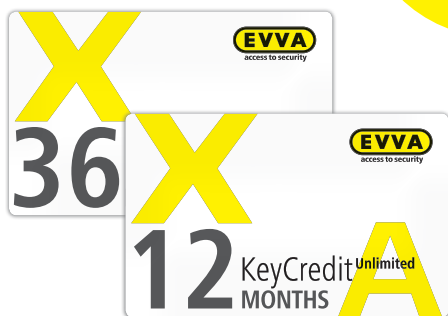

Xesar | New access authorisations in return for KeyCredits

Just enable the virtual network

The Software^{plus} card which is needed for activating the virtual network feature is available from EVVA specialist retailers. Just expose the code on the rear of the card, enter it in the Xesar software in the Software^{plus} package section to become the proud owner of a new virtual network for a period of three years.

Free software
with
Pay per key

KeyCredit Unlimited

Pay per key – only pay for what you need.

Thanks to KeyCredits, available from your EVVA Partner.

Two variants are available:

For systems with just a few users and/or infrequent changes to access authorisations, we offer KeyCredits 10, 50 or 100. KeyCredits Unlimited is designed for larger systems and frequent changes and offers validity periods of one to three years.

Why KeyCredits?

Xesar KeyCredits are required for assigning new electronic keys or changing access authorisations.

Enter the code concealed under the scratch field on KeyCredit cards into the Xesar software to — for instance — directly allow person 1 to access and exit door 1 and door 2 during certain times.

Deleting access authorisations is free of charge.
